Verifai

AI-Powered Deep Research Agent for Fact-Checking

In today's world, false news and misinformation travel at a high speed; it is difficult to distinguish between reality and lies.

The solution to this problem comes in the form of an AI-based system called Verifai. The working process of Verifai can be described as that of a research assistant who takes a statement and checks it from several sources on the Internet to determine its veracity.

Verifai then presents its analysis in a format including a Truth Score, a True / False label, and sources as evidence.

Thus, fact-checking with Verifai is made easy and efficient. Since everyone should have access to the truth immediately.

Problem Statement

The rapid spread of fake news and misinformation across digital platforms significantly impacts public opinion, creates confusion, and can lead to serious social and political consequences. There is a lack of reliable, real-time tools that can help users verify the authenticity of news content.

Pitch

We've built an AI-powered trust engine that detects whether news is real or fake in real time. It's offered as a B2B SaaS API and dashboard for media platforms, apps, and enterprises. Clients pay per API call or via monthly subscriptions, creating predictable recurring revenue. Our solution also enables journalists to verify sources, platforms to moderate content, and brands to track misinformation about themselves.

We target high-value segments including digital media companies, corporates, and government bodies such as Press Information Bureau. With strong margins and scalable infrastructure, this becomes a high-growth, defensible business in the trust economy, solving a global problem while generating consistent revenue streams.

Innovation:

Verifai is different because it doesn't just "answer" like normal AI. It works like a smart researcher—it breaks the claim, searches the internet, reads real articles, and then checks what is true or false. It also shows a Truth Score and evidence, so users can clearly see how the result was made.

- In India, police recently flagged old videos shown as new violence during elections.
- A 2020 protest video was falsely shown as a 2026 event to create panic.

Feasibility

This project is easy to build because it uses existing tools like APIs for AI, search, and web data. You don't need to create everything from scratch. It can even run mostly in the browser, so it is low-cost and scalable.

Platforms already use:

Groq: Breaks the claim into search queries and analyzes evidence to give the final verdict.

Tavily Search API (Researcher): Finds relevant and latest news/articles from the internet.

Jina Reader API (Data Extractor): Converts web pages into clean readable text for analysis.

LangChain (Framework): Connects all tools together and manages the workflow smoothly.

Viability

Fake news is a big problem today, so this idea has strong real-world use. It can be used by students, journalists, and everyday users. In the future, it can grow into a Chrome extension or WhatsApp bot and even earn money with premium features.

- AI-generated fake war visuals are spreading online to manipulate people.
- Drug cartels spread fake news to create panic and exaggerate violence.

Impact

Verifai has a strong real-world impact because it helps people quickly identify whether information is true or fake using real evidence from the internet. In today's world, where misinformation spreads very fast through social media, Verifai acts like a personal fact-checker that saves time, reduces confusion, and builds trust. Instead of blindly believing viral posts, users can verify claims in seconds and make informed decisions. It not only stops the spread of fake news but also helps users become smarter and more aware while consuming online content.

Solution

- Verifai is an AI-powered fact-checking system
- Combines AI + Real-time Web Search + Data Analysis
- Works like an investigative journalist, not a chatbot
- Verifies claims using live internet evidence
- Provides Truth Score (0–100) + clear verdict
- Shows sources and contradictions for transparency

How it Works

Verifai works like a smart researcher. When a user enters a claim, the system breaks it down, searches the internet for the latest information, reads multiple sources, and compares them to find the truth. Finally, it gives a clear verdict with a Truth Score based on real evidence.

Steps:

- User enters a claim
- AI breaks it into simple queries
- Searches real-time web data
- Collects information from multiple sources
- Analyzes and compares the data
- Detects truth, contradictions, or missing context
- Generates final verdict with Truth Score

KEY FEATURES

Powerful features that make Verifai your trusted truth verification partner.

Real-time Fact-Checking

Fetches the latest information from the internet in real-time.

Truth Score (0-100)

Provides a clear truth score to represent the accuracy of the claim.

Clear Verdict

Delivers an easy to understand verdict: True, False, or Misleading.

Source-Based Verification

Shows reliable sources and links for full transparency.

Detects Contradictions

Identifies conflicting information across multiple sources.

Deep Analysis

AI reads and analyzes multiple sources to find the real truth.

AI-Powered Intelligence

Uses advanced AI to understand context and verify accurately.

Fast & Automated

Quickly processes the claim and delivers results in seconds.

User-Friendly

Simple, clean and easy to use for everyone.

Privacy Focused

Your data and searches are secure and protected.
